The activity of derivative of the invention may be described as, antiallergic, antiasthmatic a dermatological. They act as cathepsin S inhibitors and may be used the treatment of allergic conditions including atopic allergies, e. fever, asthma, atopic dermatitis, food allergies and allergies to d. pollen, mold, pet dander or pet hair. The current sequence represent cathepsin S inhibition assay substrate peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

The method is used for treating allergic conditions, e.g. hay fever, asthma, atopic dermatitis and food allergies. The present sequence represents human cathepsin S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of treating allergic comprising administration of a composition comprising a
                               The present sequence is a peptide used as substrate for a cathepsin S inhibition assay. The Kmm for the substrate is arou by but the presence of substrate inhibition makes kinetic analysis difficult. With 20 uM substrate, the assay rate is linear over the range of 1-8 ng cathepsin S in 100 ul reaction. Using 2 ng/well of cathepsin S, the production of product is linear and yields about 7-fold signal after 20 min with only 20 loss of substrate. Primary assays are run by quenching the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 37;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the treatment of allergic conditions, comprising the administration of a pyrazole derivative. The activity of derivatives of the invention may be described as, antiallergic, antiasthmatic and dermatological. They act as cathepsin S inhibitors and may be used for the treatment of allergic conditions including atopic allergies, e.g. hay fever, asthma, atopic dermatitis, food allergies and allergies to dust, pollen, mold, pet dander or pet hair. The current sequence represents a cathepsin S inhibition assay substrate peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treatment of allergic conditions e.g. atopic dermatitis or asthma comprises administration of pyrazole derivative that inhibits cat \mathbf{S}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

                                                                                                                               The present sequence is a peptide used as substrate for a cathepsin S inhibition assay. The Km for the substrate is aroung the bull of the presence of substrate inhibition makes kinetic analysis difficult. With 20 uM substrate, the assay rate is linear over the range of 1-8 ng cathepsin S in 100 ul reaction. Using 2 ng/well of cathepsin S, the production of product is linear and yields about 7-fold signal after 20 min with only 20% to the product of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cathepsin S; inhibitor; allergy; hay fever; asthma; food allergy; atopic dermatitis; antiallergic; antiasthmatic; dermatological; antiinflammatory; immunosuppressive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of treating allergic conditions comprising administration of a composition comprising a substituted pyrazole (I) or a salt, amide or estar altergic conditions, e.g. hay fever, asthma, atopic dermatitis and food allergies. The present sequence represents human cathepsin S substrate peptide used in an assay to demonstrate the method of the
loss of substrate. Primary assays are run by quenching the reaction after 20 min and then measuring the fluorescence. other assays, measurements are taken every min for 20 min. rate is calculated from the slope of the increase and the pe

The invention describes an isolated mammalian secreted polypeptide (MSP) (C (I) (I) is useful to direct the secretion of other proteins of interest from a host cell, to monitor secretion of proteins, to degenerate sequences comprising all nucleotide sequences encoding a particular polypeptide, to screen for cell metabolism effecting receptors, for identifying new target receptors and drug design, for identifying, for complimental protein purification, for determining the weight of expressed MSP completed as a ratio to total protein expressed, for identifying peptide cleavage sites, for coupling amino and carboxy terminal tags, for manno acid sequence analysis, for monitoring biological activities of the protein in vitro and in vivo, and to teach analytical skills and as reagents for the study of cells, receptors, and other binding molecules. The polynucleotide is useful for radiation hybrid mapping, and somatic contiguous maps of mammalian chromosomes. Reagents disclosed in the invention may be used to detect metabolic abnormalities characterised by over or under production of the protein. This is the amino acid sequence of a mammalian secreted polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inhibition is calculated from this. The present invention relates to the use of cathepsin S inhibitors to treat an allergic condition, especially an atopic IgE-mediated allergic condition such as hay fever, asthma, atopic dermatitis or a food allergy (claimed). The allergens may include dust, pollen, mould, and pet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated mammalian secreted polypeptide useful in therapeutic and diagnostic methods, to direct secretion of other proteins of interest from host cell, as educational tools, and as laboratory practicum kits

                                                                                                                                                                                                                                                                                   of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a sequence complementary to a polynucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length and AAH13633 to AAH18742 represent human cold sequences; AAB92446 to AAB95893 represent human amino acid sequences; AAB9245 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                     Matches

                                                                                                                                                                                                                                    AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ54473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neisseria meningitidis; Neisseria gonorrheae; antigenic; diagnosis; immunogenic; infection; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                            AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Neisseria meningitidis; Neisseria gonorrheae; antigenic; diagnosis; immunogenic; infection; antibacterial; gene therapy.

Petersen J,
Tettelin H,
                                                                                                    represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ5447 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                             The present invention describes a composition (I) comprising a prepared CD inuman immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequences (ABL25347 to CD ABP25397). (I) has virucide activity and can be used in vaccines. (I) CD may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines (I) CD particularly when compared to the use of whole antigens in vaccine CD compositions. There is evidence that the immune response to whole compositions is directed largely toward variable regions of the antigen, CD allowing for immune escape due to mutations. The groups for inclusion in CD composition and the use of whole antigen, and group-based vaccine may be selected from conserved regions of viral or CD composition antigens, which therefore reduces the likelihood of CD composition antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the CD composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as CD immunogenicity. Accordingly, the immune response can be modulated, as not possible with traditional approaches.                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a composition (I) comprising a prepared CC human immunodeficiency virus-1 (HIV-1) group comprising an amino acid compone selected from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (I) has virucide activity and can be used in vaccines. (I) CC may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines cc particularly when compared to the use of whole antigens in vaccine cc antigens is directed largely toward variable regions of the antigen. CC allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or ct umour-associated antigens, which therefore reduces the likelihood of ce scape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced as continuogenicity. Accordingly, the immune response can be modulated, as not possible with traditional approaches. ABP11501 to ABP25412 crepresent peptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The present invention describes a composition (1) comprising a prepared CC human immunodeficiency virus-1 (HIV-1) group comprising an amino acid Sequences selected from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (1) has virucide activity and can be used in vaccines. (1) CC may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines (2 particularly when compared to the use of whole antigens in vaccine CC compositions. There is evidence that the immune response to whole CC antigens is directed largely toward variable regions of the antigen, and group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the CC immunogenicity. Accordingly, the immune response can be modulated, as cappropriate, for the target disease. Similar engineering of the response cinvention.

CC invention.
                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                               묽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc human immunodeficiency virus-1 (HIV-1) group comprising an amino acid composition of the virus-deficiency virus-1 (HIV-1) group comprising an amino acid compositions acted from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (1) has virucide activity and can be used in vaccines. (1) compositions when compared to the use of group-based vaccines has several advantages over traditional vaccines. CC particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole callowing for immune escape due to mutations. The groups for inclusion in callowing for immune escape due to mutations. The groups for inclusion in composition for immune escape due to mutations. The groups for inclusion in composition antigens, which therefore reduces the likelihood of composition antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced in the composition of the groups, achieving, for example, enhanced as a compropriate, for the target disease. Similar engineering of the response continuous for the target disease. Similar engineering of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1 -
                                                              Luciferase; cell death.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention relates to a purified polypeptide having luciforase CC activity and a recognition site specifically cleavable by a protease, CC where cleavage results in a decrease in luciforase activity. The CC polypeptide comprises a localisation sequence which is linked to the CC luciforase polypeptide by the cleavable recognition sequence. The CC modulator, an inhibitor of apoptosis and for detecting luciforase contivity in a sample. The polypeptide is used for characterising and CC identifying cellular processes associated with metabolism, cell growth CC and cell death e.g. apoptosis and for measuring protease activity. The CC ellular biochemical pathways are useful for characterising, identifying cellular biochemical pathways as well as identifying diagnostic and CC cellular biochemical pathways as well as identifying diagnostic and CC study agents or conditions that cleave the recognition site and for CC determining amount of protease in side a cell that expresses a recombinant colluciforase. The prosessing and for monitoring the colluciforase. The present sequence is a protease peptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                             cc and a protesse recognition site (PRS) cleavable by a virally encoded contended, where cleavage of the PRS leads to a detectable signal. The nucleic acid construct of the invention is useful for uncovering consecules having antiviral activity or for determining viral drug cresistance and the chimeric peptide is also useful for detecting the presence of a virus in a cell. Other uses of the invention are detecting the presence of viral infection. The nucleic acid construct is useful for construct is useful for the invention enables screening of molecules in an easy and rapid manner can allows efficient detection of the presence of viral particles within cells. The construct is specific, sensitive and construct is particles within cells. The construct is specific, sensitive and construct is particles within cells. The construct is specific, sensitive and consectivity in the absence of human consection of the presence of viral particles. When the construct is specific viral strain isolates even under low viral load conditions. When used for phenotypic testing of HIV drug resistance it delivers accurate cresuits within 24 hours. The present amino acid sequence represents one of several (AAU75794-AAU75798) HIV Gag protein protease cleavage

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score

In FUNCTION: TROPONIN T IS THE TROPOMYOSIN-BINDING SUBUNIT OF TROPONIN, THE THIN FILAMENT REGULATORY COMPLEX WHICH CONFERS CALCIUM-SENSITIVITY TO STRIATED MUSCLE ACTOMYOSIN ATPASE ACTIVITY.
I-ALTERNATIVE PRODUCTS: 2 isoforms; 1/Embryonic form (shown here) and 2/Adult form; are produced by alternative splicing.
SIMILARITY: BELONGS TO THE TROPONIN T FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-JUL-1986 (Rel. 01, Created)

Sequences of complete cDNAs encoding four variants of chicken skeletal muscle troponin T.";

J. Biol. Chem. 263:18816-18820(1988).

-i- FUNCTION: TROPONIN T IS THE TROPOMYOSIN-BINDING SUBUNIT OF TROPONIN, THE THIN FILAMENT REGULATORY COMPLEX WHICH CONFERS CALCIUM-SENSITIVITY TO STRIATED MUSCLE ACTOMYOSIN ATPASE ACTIVITY.

-i- ALTERNATIVE BRODUCTS: AT LEAST 4 ISOFORMS; TMT-1, TWT-2, TMT-3, SIGWN HERE) AND TMT-4; ARE PRODUCED BY ALTERNATIVE SPLICING.

-i- SIMILARITY: BELONGS TO THE TROPONIN T FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VARSPLIC
